# New Socket 370 Product

# New Socket 370 Product

## Socket370 / Intel Solano Chipset

**ME21** is a MicroATX mainboard equipped with 815E chipsets and supports 1 AGP / 3PCI / 1CNR / ATA100 / 2DIMM / built in graphics engine / 4USB ports

**AE22** is the ATX version of ME21 with same features, but 6PCI and 3DIMM.

**AE23** equipped with 815EP chipsets has same features like AE22, but no built in graphics engine. COM 2 port is placed back to I/O port on back panel which will be more suitable for channel market.

**AE25** is the successor of AE23 and uses the B-stepping of 815EP chipsets to support both New Pentium III (Tualatin) CPU and Legacy Pentium III and Celeron. It also equipped with ATA100 IDE RAID and Hardware Audio controller to provide a better performance platform.

## Socket370 / VIA Chipset / ATX-Format

**AV18E** is same designed as AV18, but equipped 686B south bridge instead of 686A, so that it may support ATA100 interface.

**AV30/AV32** both use VIA Pro266 chipsets. The most difference is **AV30** supports 3 DDR DIMM and **AV32** supports 2 DDR DIMM and 2 SDR DIMM.

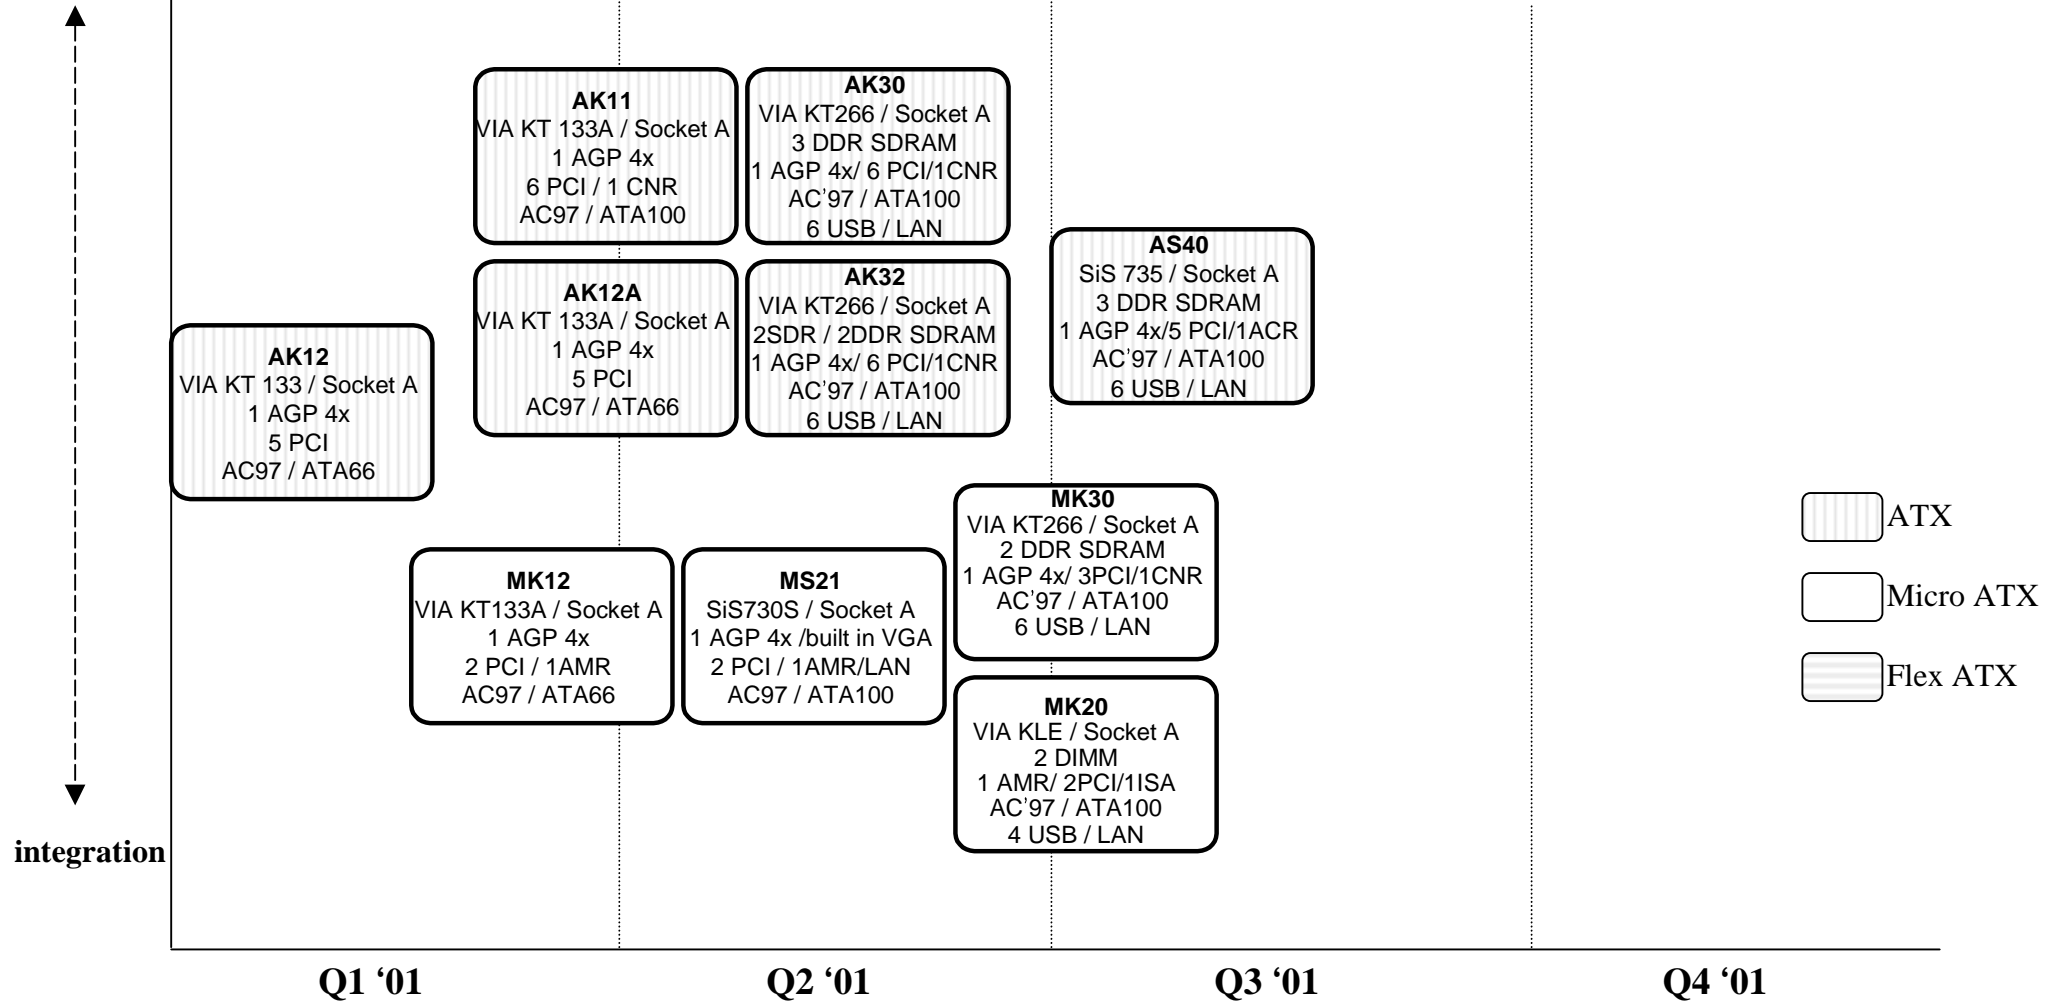

## Socket370 / Flex-ATX-Format

**FE22** is a FlexATX board and measures 17x17cm, only. It features built in graphics incl. 4 MB Z-Buffer with VGA and Flat Panel connector, integrated Realtek 8139C 10/100M Ethernet controller, AC'97 audio, and 1 PCI.

**FV24** is a proprietary designed for special FATX chassis. It support TV-out (optional), 4 USB ports, 1394, 10/100 Ethernet, proprietary modem riser and 1 PCI function in a compact size.

# AMD Series (Socket A)

Mainstream

# AMD Series (Socket A)

## Socket A

**AK12** equipped with VIA KT133 chipsets. With supporting high performance K7 CPU, it is positioned in a best cost / performance ratio product.

**AK11** is equipped with the VIA KT133A chipset, which supports the Athlon-C at 133MHz (266MHz FSB). AK11 has more built in features to support a better over-clock capability than AK12. It has 6 PCI slots and 1 CNR slots to give users the maximum expansion ability.

**AK30** will use KT266 chipsets to support AMD K7 CPU at 133MHz DDR FSB and 3 DDR DIMM.

**AK32** is the AK30's sister board, but supports 2 DDR + 2 SDRAM to make a good upgrade capability.

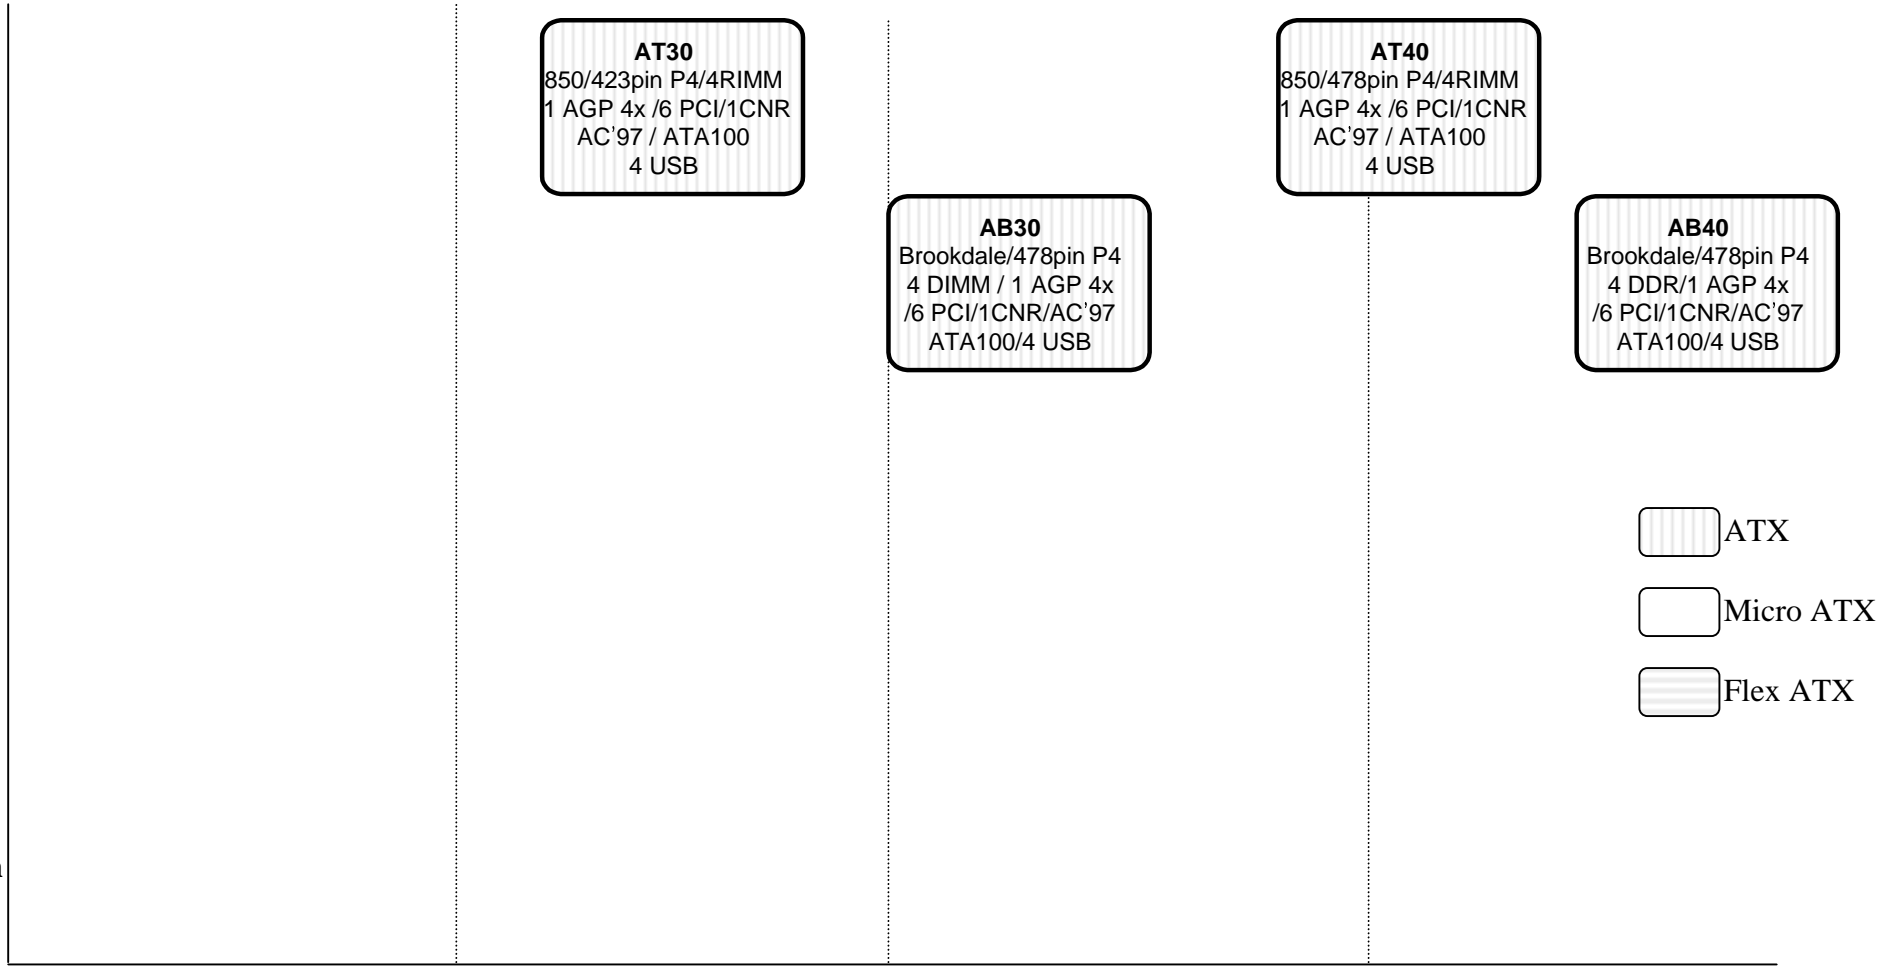

# Pentium 4 Series

-  Micro ATX
-  Flex ATX

# Pentium 4 Series

## Pentium 4

Intel decide to accelerate P4 market in 2001, so it decides to pull in the SDRAM and DDR P4 chipsets, Brookdale, into the market this year.

**AB30** is the SDRAM version Brookdale based motherboard. It will makes the P4 motherboard ramp up in Q3 in the main-stream PC market.

**AB40** is the DDR SDRAM version of Brookdale based motherboard. It provide another platform with high performance memory bandwidth technology. Compared with RDRAM based P4 platform, AB40 is a much more cost effective solution on P4 platform.

## Technical Note:

**LAN function** is mainly composed by two different parts. One is **MAC** (Media Access Controller) and another is **PHY** (Physical Layer). ICH2, SiS635/SiS730S/SiS735, and VIA 8233 has a built in LAN MAC, so system integrator needs to add a CNR equipped with a proper PHY to get the 10 / 100Mb Ethernet or 1 / 10Mb HomePNA function.

**CNR** (Communication and Network Riser) is a new interface defined by Intel to supports additional function such as 10 /100 Mb Ethernet, 1 / 10 Mb HomePNA, Multi channel (4 or 6) audio, or Modem. Manufacturer may bundle one or two of these function on a same CNR card.
